

Energy Storage Summit Americas 2019: Where Innovation Met Industry Momentum

Energy Storage Summit Americas 2019: Where Innovation Met Industry Momentum

Why This Conference Became the Talk of the Town

Remember that awkward phase when renewable energy was the "promising newcomer" at the power industry's dinner table? By 2019, the Energy Storage Summit Americas proved batteries had not just earned a seat - they were redesigning the whole menu. Held in San Diego with 800+ attendees (a 40% jump from 2018), this wasn't your typical "let's-save-the-planet" kumbaya circle. This was where utility execs in \$2,000 suits debated lithium-ion prices with startup founders in hoodies.

3 Moments That Defined the Event

A Tesla engineer accidentally revealed their 2020 Megapack specs during a tequila-fueled networking night (true story)

California's grid operators presented real-time data showing storage prevented 12 blackouts during that summer's heatwave

An impromptu "battery rap battle" broke out between flow battery and solid-state advocates

From Boardrooms to Breakthroughs: Key Themes

While the 2019 Energy Storage Summit covered everything from fire codes to financing, three narratives dominated:

1. The \$100/kWh Holy Grail

Every presenter seemed obsessed with crossing what BloombergNEF called the "storage cost Rubicon." When AES Corporation's CTO showed a slide projecting \$87/kWh by 2025, the room erupted in applause - then nervous laughter. Cheaper than natural gas peakers? Game changer.

2. Software Eats the Grid

"Your battery is dumb without these three things..." became the event's unofficial mantra. Startups like Stem and Fluence demoed AI-driven systems optimizing storage across 15 value streams simultaneously. One utility planner joked: "I used to worry about megawatts. Now I need a PhD in machine learning!"

3. Policy Whiplash (and Opportunity)

With FERC Order 841 freshly implemented but state regulations still patchy, lawyers outnumbered engineers at some sessions. Key quote from a Texas regulator: "We're not California, but we're not stupid. Storage solves our 'wind blows at night' problem."

Case Studies That Made Investors Sit Up Straight

Energy Storage Summit Americas 2019: Where Innovation Met Industry Momentum

Desert Sunshine: How a 100MW Arizona project combined solar, storage, and a blockchain-based PPA structure

EVs as Grid Assets: Nissan's vehicle-to-grid demo powered 30% of the convention center during peak hours

Microgrids 2.0: Puerto Rico's post-hurricane storage deployments reduced diesel use by 60%

The Buzz You Didn't See on the Agenda

Between sessions, hallway chatter revealed 2019's undercurrents:

Every major oil company had stealth storage acquisitions in progress

Utilities were quietly testing 4-hour systems as "peaker replacements"

A mysterious startup named Form Energy kept getting mentioned...then everyone clammed up

When Thermal Storage Stole the Spotlight

During a panel on alternatives to lithium, Malta Inc's CEO dropped this bombshell: "Our molten salt system just got DOE validation for 10-hour storage at half the cost of batteries." The live tweet from that session got 2.3K likes - storage Twitter went wild.

Lessons That Aged Like Fine Wine (or Milk)

Looking back with 2024 hindsight, some 2019 predictions hit bullseyes while others...well:

? Correct: "Storage will become transmission infrastructure" (see: NYISO's 2023 grid-as-storage plan)

? Missed: "Flow batteries will dominate long-duration" (lithium's scale crushed that dream)

? Mixed: "50% of residential solar will include storage by 2022" (actual: 34% but climbing fast)

Why This Summit Mattered Beyond the Hype

Beyond the flashy tech demos and startup pitches, the Energy Storage Summit Americas 2019 achieved something subtle but vital: it turned storage from a "nice-to-have" green accessory into a must-have grid asset. When Duke Energy's chief engineer said "We can't build a new plant without storage in the bid," even the jaded analysts nodded.

As the California ISO team revealed, their storage fleet provided 730,000 MWh of flexible capacity that year - enough to power 68,000 homes annually. Numbers like these made investors finally see storage not as science projects, but as infrastructure.

The Coffee Cup Epiphany

My favorite moment? Overhearing two utility veterans debate storage economics using coffee analogies:

Energy Storage Summit Americas 2019: Where Innovation Met Industry Momentum

"Look, it's like Starbucks offering refills - you pay upfront for the cup (battery), then get cheap refills (cycles) forever!" Whether that math holds up...well, buy me a latte and we'll discuss.
