

# Why the 2017 Energy Storage Conference Was a Game-Changer (And What It Means for You)

Why the 2017 Energy Storage Conference Was a Game-Changer (And What It Means for You)

When Batteries Met Brainpower: Inside the Energy Storage Conference 2017

most industry events are about as exciting as watching battery acid dry. But the 2017 Energy Storage Conference in San Diego? That was the Woodstock of wattage. Picture 2,500 engineers, policymakers, and energy geeks arguing about lithium-ion densities like sports fans debating touchdowns. I saw a venture capitalist literally sprint between sessions when he heard about Tesla's latest Powerpack specs.

Three Shockwaves From the Conference Floor

The 48-hour scramble to get into Dr. Imre Gyuk's grid-scale storage workshop (pro tip: arrive early for the 2018 event)

Southern California Edison's reveal of their 80MW storage project - enough to power 60,000 homes during peak hours

The "great electrolyte debate" between flow battery purists and solid-state upstarts that almost came to blows

Storage Solutions That Stole the Show

While everyone was buzzing about Tesla's 20MW Australian battery project (you know, the one that made headlines), real innovation was happening in the exhibit hall. Startups like Stem and Green Charge Networks showed how AI-driven storage could cut commercial energy bills by 30% - with payback periods under 4 years. Not exactly pocket change.

Case Study: The Ice Cream Truck That Powered a Convention Center

Here's where it gets wild. Ice Energy brought a modified ice cream truck using their "Ice Bear" technology. This frozen water-based system:

Shifted 500 kWh of cooling load daily

Reduced peak demand charges by 40%

Kept conference attendees supplied with free popsicles

Talk about a sweet demonstration of thermal energy storage!

Policy Meets Physics: The Regulatory Revolution

The real plot twist? While techies geeked out over battery chemistry, policymakers quietly rewrote the rulebook. FERC's Order 841 proposal (released that November) essentially created a roadmap for storage participation in wholesale markets. States like Massachusetts and New York rolled out storage mandates that would make California's 1.3GW target look timid.

# Why the 2017 Energy Storage Conference Was a Game-Changer (And What It Means for You)

Storage Economics 2.0

Navigant Research dropped a bombshell report showing:

Metric

2016

2025 Projection

Global Storage Deployments

1.4GW

14.8GW

System Costs (\$/kWh)

\$700

\$250

Suddenly, every utility planner in the room needed antacids.

The Storage Trifecta: Tech, Policy, Markets

Three factors collided at the 2017 conference to create the perfect storage storm:

Technology Leapfrogging: Lithium-ion costs fell 24% year-over-year while density improved 17%

Regulatory Tailwinds: 29 states had active storage policies by conference end

Market Structures: CAISO's storage-centric grid ops showed 94% reliability improvements

When VR Met BESS

ABB's virtual reality demo let users "walk through" battery energy storage systems (BESS). Cue grown engineers giggling like kids as they pulled apart virtual battery racks. One utility exec accidentally "dropped" a virtual transformer - let's hope that's not a job requirement.

Storage Gets Sexy (Yes, Really)

The unspoken theme? Energy storage stopped being the nerdy cousin of solar. With vehicle-to-grid tech demonstrations and blockchain-enabled microgrids (look up LO3 Energy's Brooklyn project), storage became the cool kid at the energy party. Even the after-hours events had juice - literally. The opening reception powered its entire lighting system using repurposed EV batteries.

# Why the 2017 Energy Storage Conference Was a Game-Changer (And What It Means for You)

## Five Questions Every Attendee Asked

- "Is lithium-ion the final answer or just Chapter 1?"
- "How soon before storage beats peaker plants on cost?" (Answer: 2.3 years)
- "Will FERC Order 841 survive the Trump administration?" (Spoiler: It did)
- "Can storage save nuclear plants?" (FirstEnergy thinks so)
- "Where's the damn coffee?" (Line stretched around the block)

## Storage Wars: West Coast vs. East Coast

The most heated debate wasn't technical - it was geographical. California's SGIP program had just hit \$800 million in storage incentives, while New York's REV initiative promised to reinvent utility models. Meanwhile, Texas developers quietly smirked - ERCOT's merchant market already had 1.2GW of storage in development. Cue the chest-thumping.

## Pro Tip From a Conference Veteran

Want the real industry scoop? Skip the keynotes and haunt the poster sessions. That's where MIT researchers first floated the idea of "cryogenic energy storage" using liquid air. Sounds crazy? UK's Highview Power is now building 50MW plants using exactly that tech. Missed connections? More like missed megawatts.

## The Storage Ecosystem Matures

By the closing panel, one truth became clear: Storage was no longer a standalone solution. The 2017 conference revealed an emerging ecosystem integrating:

- Demand response platforms
- Distributed energy resource management (DERMs)
- Advanced forecasting algorithms
- Cybersecurity protocols (after that scary DOE grid hack report)

And let's not forget the coffee. So much coffee. Rumor has it the venue's power bill that month had a mysterious 37% demand charge reduction...
